-i- FUNCTION: C/EBP IS A DNA-BINDING PROTEIN THAT RECOGNIZES TWO DIFFERENT MOTIFS: THE CCAAT HOMOLOGY COMMON TO MANY PROMOTERS.

THE ENHANCED CORE HOMOLOGY COMMON TO MANY ENHANCERS.

-i- SUBUNIT: BINDS DNA AS A DIMER.

-i- SUBCELLULAR LOCATION: NUCLEAR.

-i- TISSUE SPECIFICITY: UBICUTTOUSLY EXPRESSED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA_BIND

TISSUE SPECIFICITY: IT IS PRESENT IN THE ADULT KIDNEY, TESTIS, LIMB, OVARY, BRAIL, SMALL INTESTINE, SALIVARY GLAND AND HARDERIAN GLAND. IT IS PRESENT THROUGHOUT THE EMBRYO.

DEVELOPMENTAL STAGE: IN THE DEVELOPING LIMB BUD, THE PROTEIN IS EXPRESSED IN THE APICAL ECTODERWAL RIDGE AND THE MESENCHYMAL COMPARTMENT, PREDOMINANTLY IN THE POSTERIOR REGION. DURING KIDNEY MORPHOGENESIS, EXPRESSION IS INITIALLY RESTRICTED TO THE EPITHELIAL COMPARTMENT OF THE PRONEPHROS. AND MESONCEPHROS.

Title:

Description: Perfect Score: Sequence: >US-08-799-910-10 (1-156) from US08799910.pep 1114 1 MCHSRSCHPIMTILQAPIPA.....EPSDYALDLSTFLQQHPAAF 156

Scoring table:

PAM 150 Gap 11

Searched: 69112 seqs, 25083644 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot35 1:swiss1

Statistics: Mean 44.412; Variance 91.621; scale 0.485

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Statistics: Mean 11.417; Variance 7.667; scale 1.489

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                 Natriuretic protein receptor B - for diagnosis and treatment of kidney failure, heart failure, hyperaldosteronism, glaucoma etc. Claim 3; Fig 1; 49pp; English.

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodn. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-RPRB analogues. The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the produc of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr=114,952). The protein has a mol wt. of 15 kD (calculated Mr=14,952) affinity chromatography. Antibodies with affinity for NPRB can also he prepare

           New nucleic acid fragment encoding gene products - can be used for genetic analysis and mapping claim 1; Page 586; 616py. English.

Human nucleic acid fragments, isolated from brain, adrenal tissue the placenta or bone marrow comprise any of: (A) a sequence as elected from (Q/6401-Q/7613), (B) an allelic variation of a sequence as described in (A), or (C) a sequence complementary to (A) or (B).

Preferred sequences exhibit no more than 90105mology to a human
                                                                                                                                                                                                                                                                                                 23-SEP-1994 (first entry)
Human genome fragment. (Preferred)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                뭥
                                                                                                                                                                                                                               CC double-stranded DNA (or its complementary strand or the corresp. CC double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of CC human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) Sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-cuntranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be constructed as a means of diagnosing abnormal cell function or for recognising different cell types.

Claim 3; Page 14; 23pp; English.
Oligonucleotide probe MK14-A consists of nucleotides
(051735). It hybridized to all spp. of mycobacteria tested,
cross reacted to a few non-mycobacterial spp. The probe may
be useful as an initial screen for mycobacterial infection.

Oligonucleotide probe MK14-A consists of nucleotides 5-85 of (051735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

Random point mutations were introduced into the alpha fragment of E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misinocorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                                                                                                                                                                                                                                           1075

PT Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins processing a binding domain and an effector domain proteins promprising a binding domain and an effector domain proteins promptising a binding domain and an effector domain proteins of prot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-FEB-1993;

PT Identifying proteins or peptide(s) which bind a ligand - by Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins processing a binding domain and an effector domain

Screening a personal protein of the peptides. This generic formula can also be converted as follows: x(NNB)1(CAC)(NNB)1(CAC)(NNB)1(CAC)(NNB)1(CAC)(NNB)1(CAC)(NNB)1(CAC)(NNB)1(CAC)(NNB)2z(NNB)6.

CC (Also not the same as y) that are not specified further. The peptides comparated by this and other generic sequences (70470-73) have invariant the protein of the same as y) that are not specified further. The peptides concatenated by this and other generic sequences. Takes are concatenated by this and other generic sequences. Takes are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically can be used in the two functional regions. Comprise a linker peptide between the 2 domains. The TSARs or compans. comprise a linker peptide between the 2 domains. Compans to the cell. They can also replace the function of macromolecules, eg. mental concepts and the cell. They can also replace the function of macromolecules, eg. mental concepts whether the production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.

CC monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in two antibody.

CC manner the can also replace the function of macromolecules, eg. metal concepts and the concepts and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ç
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.

                                                                                                                                                                                                                    CC Q70468 is a generic DNA sequence used to generate random TSAR (Totally CC Q70468 is a generic DNA sequence) used to generic formula can also be compresented as follows: X(NNB)11(TGC)(NNB)6Z(NNB)7(TGC)(NNB)10X. X CC and x are flanking restriction sites (X is not the same as y) that are cont specified further. Other generic sequences are shown in Q70466-68. CC chemically or peptides generated by these generic sequences are shown in Q70466-68. CC comprising at least two functional regions - a binding domain with CC affinity for a ligand and a second effector peptide portion that is CC chemically or biologically active. They may further comprise a linker CC chicken the expressed peptide contains 2 or 4 cysteine residues positioned CC in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARS CC comprising a TSAR binding domain can be used in vivo to CC deliver a chemically or biologically active moiety, eg. metal ion, CC cradioisotope, peptide, toxin or enzyme, to the specific target or on the componex methods of hybridoma formation or in vivo antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁

CC Q70467 is a generic DNA sequence used to generate random TSAR (Totally

CC Synthetic Affinity Reagents) peptides. This generic formula can also be

CC represented as follows: X(NNB)16(TGC)(NNB)12(NNB)16(TGC)(NNB)1y. X

CC and Y are flanking restriction sites (X is not the same as Y) that are

CC not specific peptides generated by these generic sequences are shown in Q70466-68.

CC Other specific peptides generated by these generic sequences are shown in

CC R65131-54. TSARs are concatenated heterofunctional proteins or peptides,

CC comprising at least two functional regions - a binding domain with

CC affinity for a ligand and a second effector peptide portion that is

CC comprising at least two functional regions - a binding domain with

CC that the expressed peptide contains 2 or 4 cysteine residues positioned

CC in or flanking, the unpredicted or variant residues. These residues

CC composes comprising a TSAR binding domain can be used in vivo to

CC deliver a chemically or biologically active moiety, eg. metal ion,

CC composes, peptide, toxin or enzyme, to the specific target or on the

CC compose peptide toxin or enzyme, to the specific target or on the

CC compose of the periods of the function of macromolecules, eg.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

```
Example 6; Fig 13; 296pp; English.

CC This sequence shows the central portion, including the C-terminus CC of the alpha-helix region and some of the proline-rich region, of CC pneumococcal surface protein A (PspA) of Streptococcus pneumoniae CC strain Bg9739. Comparison of the N-terminal and central regions CC (W14533-57 and W14562-91) of PspA polypeptides from different CC pneumococcal strains can be used to divide the strains into several CC framilles based on sequence homologies. PspA polypeptides, or CC fragments of them, can be used in vaccines to protect animals CC against S. pneumoniae infection and hence for the prevention of CC diseases such as otitis media, meningitis, bacteraemia and pneumonia. CC The sequence of the 3' half of the PspA alpha-helical region and the cc immediate 5' tip of the coding sequence are likely to be the critical sequences for predicting PspA cross-reactions and vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT

Claim 5; Page 164-108; 254pp; English.
A clone encoding the chitinase 1 gene was isolated from a sugar beet EMBL3 genomic library. The sequence encodes a protein having 439 amino acid residues. Transgenic plants having increased resistance to nematodes and chitin-containing plant pathogens, partic. fungi, can be produced using genetic constructs containing the chitinase 1 gene. The protein itself can be used in fungicidal
                                                                                                                                                                       R53072 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ic adrenergic receptor with a binding affinity greater than ten-fold higher than the binding affinity with which the compound binds to a human alpha-1A adrenergic receptor or a human alpha-1B adrenergic receptor. The example concerns a protocol for the determination of the potency of alpha-1 antagonists. Cell lines were prepd. by transfecting the cloned cDNA or cloned genomic DNA or constructs contg. both genomic DNA and cDNA encoding human alpha-adrenergic receptors. For alpha-1A, the entire coding region and 5' and 3' UTRs were cloned into the BamHI and ClaI sites of the polylinker-modified eukaryotic expression vector pCEXJ-HR. For alpha-1B, the entire coding region and 5' and 3' UTRs were cloned into the EcoRI site of pCEXY-3 eukaryotic expression vector. For alpha-1C, the entire coding region and 5' and 3' UTRs were cloned into the KpmI site of the polylinker-modified concerns a protoconcerns a protoconcerns a protoconcerns a protoconcerns a protoconcerns a polylinker-modified concerns a protoconcerns a protoconcerns a protoconcerns a polylinker-modified concerns a protoconcerns a protoconcerns a protoconcerns a protoconcerns a protoconcerns a polylinker-modified concerns a protoconcerns a protoconcerns a protoconcerns a protoconcerns a polylinker-modified concerns a protoconcerns a prot

Claim 43; Fig 2; 155pp; English.

In order to isolate a full length clone for the alpha 1 adrenergic receptor human cDNA libraries were screened by PCR with primers designed off the isolated genomic clones, from non conserved portions of the receptor gene. The PCR prod. was then used as a probe to isolate the full length alpha 1 adrenergic receptor gene. The gene can be used for screening for abnormalities associated with human alpha 1 adrenergic receptors, e.g. prostatic hypertrophy, coronary heart disease, insulin resistance, hypertension, urinary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14-APR-1994.
